Heuristic Evaluation

1. User control and freedom:

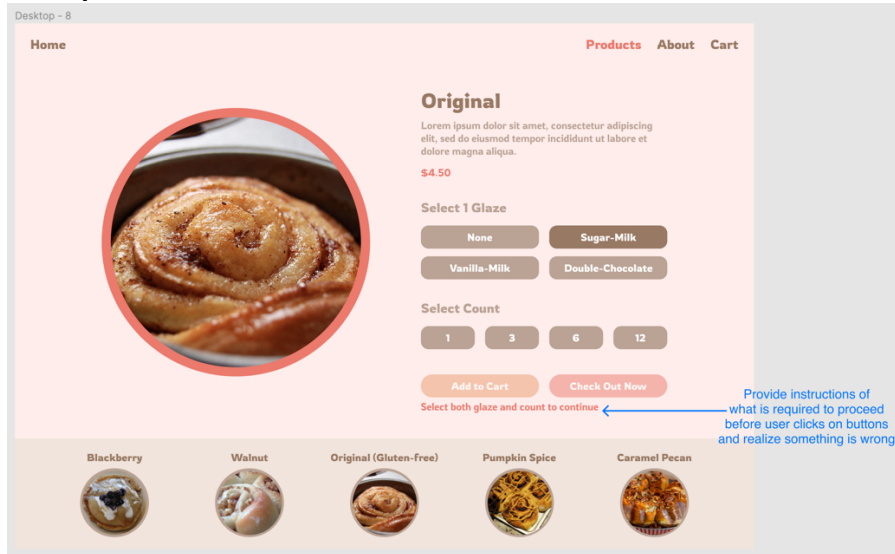

The current design doesn't provide an easy way to go back to the previous page quickly. Therefore, to provide this freedom of flexible navigation, I added a button called "Back to All Products."

2. Consistency and standards:

I should consistently use one designated color for a specific purpose. For example, I used the red color for both “add to cart” and “check out now,” which may confuse the users as both buttons serve different purposes but are in the same color.

3. Error prevention:

To communicate to the user that they cannot proceed before selecting a glaze and count, I lowered the opacity of the buttons and wrote an instruction prompting the user to make their selections. By displaying this information, we can prevent the user from attempting to proceed to the next step without completing the previously required steps.

Implementation Challenges

One of the biggest challenges was using the same component multiple times with slight changes in images and product names. I wasn't sure how I could position them next to each other instead of being stacked on top of each other. I overcame this challenge by learning how to use flexbox.

Design Choices

The brand identity of my client is the warm feelings of a just-baked cinnamon roll. Therefore, I used warm colors such as light pink and brown to enhance this feeling. Additionally, I put red borders around cinnamon roll images to display the warmth of the roll on the screen.
